About Me

I am an undergraduate student of computer science at Binus University. During my years in college, I have developed interest to be a software developer. My goal is to make apps that can solve various problems in the society. I am also highly adaptable to technological changes and always like to explore and try new things.

SKILLS

- HTML, CSS, & Javascript
- PHP & Laravel
- Dart & Flutter
- React
- C, Python, MySQL

EXPERIENCE

Mentor Binus University
Jakarta - Indonesia

Artwork/Project Description

Chocs is a popular chocolate shop and has 3 branches. The business is growing really fast and Chocs is trying to implement a website to expand its business and get more customers. The website has 5 pages that reflect Chocs' identity which includes home as a landing page that shows the best product and a brief information about the business, products where customers can browse through the products sold, purchase where customer can check out the products they chose from products, about us which contains detail information about the chocolate shop, and locations which shows the branches of the chocolate shop. At the moment the website only consist of front end elements to show the ui/ux experience and has not been integrated with backend services. The website is made with html, css, and javascript.

Artwork/Project Description

Diafit is a health tracker mobile app made for people with diabetes and those who want to maintain a healthy lifestyle. Mobile app is chosen to make it easier for our customer to track their sugar level, nutrition burned, and calories consumed. Diafit stores data inputted by user in an orderly manner to make it easier to access and to make it possible to track changes in user's sugar level represented by graphs. Diafit is also able to automatically calculate the amount of calories contained/burned from foods/exercises using a third party api and public database. On top of that diafit also provides a place for user to buy healthy food complete with nutrition facts. There is also a page for articles to increase user's awareness about diabetes and health. In order to achieve a complete system, a web-based admin page is also made to maintain food orders. The app is made using Flutter/Dart for front end, Laravel/PHP for backend, and REST API for integration

Aloha

August 2023

Full Stack Developer

Publication Link

<https://github.com/changjili/aloha>

https://github.com/changjili/aloha_backend

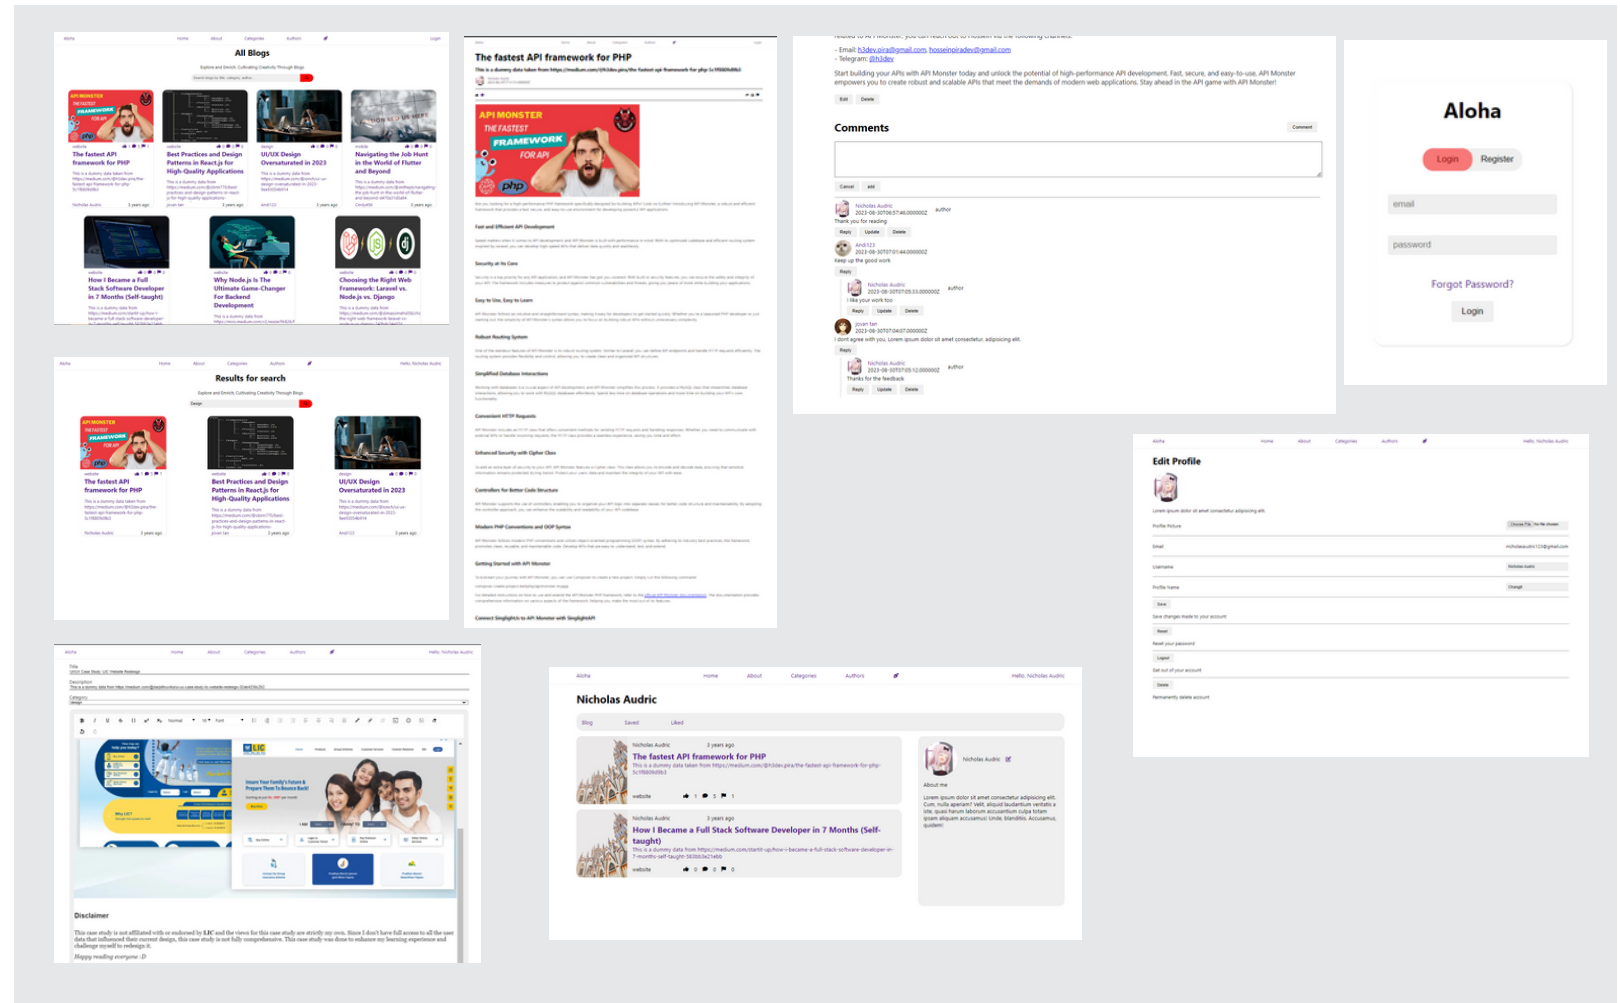

Contributors

- Nicholas Audric Surya

Artwork/Project Description

Aloha is a blog publishing platform inspired by medium.com. The website was intended to be a personal space for my blogs but the feature is extended and now everybody can login to create their own blog using the provided wysiwyg editor. There are also some additional feature such as search blog, email verification and comment section so that user can give feedback to the blogs author. This project is made using React and Sass for frontend, Laravel and MySQL for backend, and Rest API for Integration.

Talassa

Artwork/Project Description

This project is a website for Talassa, a restaurant located at PIK which at the moment doesn't have an official website yet. Through this website, potential customer will be able to see a preview of the restaurant and make reservations. This project is made using React for front end and Laravel for backend. This project is still ongoing and will extend to other restaurants in the same group of Talassa's.

Project 4 of 5

Augustus 2023

Partial Front End
Developer and Full
Back end Developer
